

INVISIGUARD – INTELLIGENT SYSTEM FOR PREDICTING CYBER THREATS REAL TIME

The image shows a login interface for the InvisiGuard Unified Dashboard. At the top, there is a purple shield icon with a white checkmark. Below it, the text "InvisiGuard Unified Dashboard" is displayed in a bold, purple font. Underneath, a smaller line of text reads "Single sign-on for EndpointAnalyze & InvisiGuard". The login form consists of two input fields: "Username *" and "Password". Below the "Username *" field, there is a small text hint: "Default: admin (automatic authentication)". Below the "Password" field, there is another small text hint: "Authentication is automatic - just click Sign In". A prominent blue button labeled "Sign In" is positioned below the password field. At the very bottom of the form, a small line of text states: "Authenticates with both EndpointAnalyze and InvisiGuard using unified credentials."

RESEARCH PROBLEM

- Existing cybersecurity systems rely heavily on signature-based and rule-based detection methods
- Cannot effectively detect Unknown attacks, insider threats and advanced persistent threats

Creates major security challenges :

- High volume of false positives
- Delayed or missed detection of multi-step attacks
- Limited ability to adapt to new attack patterns
- Difficulty processing large volumes of endpoint and log data

Primary Targets :

- Enterprise Networks
- Security Operations Centers (SOC)
- Critical Infrastructure Systems

WHY OUR SOLUTION MATTERS

- Improves early detection of unknown cyber threats
- Reduces false positives in anomaly detection systems
- Enhances security monitoring using multiple behavioral signals
- Provides real-time threat detection and visualization
- Supports scalable cybersecurity monitoring in large environments

PROJECT COMPONENTS

- Known attack predicting using user behavior analysis
- Predict Known attacks using endpoint analysis
- Predict zero-day attacks by zero day patterns
- Known attack predicting by system calls

PROJECT COMPONENTS

Summary of the solution

- A Hybrid Machine Learning Cyber-Threat Detection Framework that analyzes system calls, endpoint logs and network behavior
- Uses Unsupervised Learning to detect unknown anomalies cyber attacks
- Uses TF-IDF feature extraction to convert raw endpoint logs into meaningful representations
- Applies XGBoost for accurate classification of known cyber attacks
- Uses Deep Learning (LSTM) to capture sequential behavioral patterns of attacks

WHY OUR SOLUTION MATTERS

ML Models						
Machine Learning Model Management						
Deployed Models						
System	Model Name	Version	Performance	Status	Last Updated	Actions
EndpointAnalyze	XGBoost Classifier	2.0.2	Accuracy: 94.2% FPR: 3.1%	production	2026-03-01	View Details
IntrusionGuard	LSTM v1	1.0.0	Accuracy: 99.9% Threshold: 0.30	production	2026-02-15	View Details
Network_analyze	Hybrid Meta (Stacking)	1.0.0	Accuracy: 92.1% Threshold: undefined	production	2026-03-09	View Details

KEY FEATURES

- Real-time Cyber Attack Detection
- Hybrid Machine Learning Framework
- Multi-Source Data Analysis (Logs, System Calls, Network Traffic)
- Real time unknow Attack Detection Capability
- Adaptive Risk Scoring and Alert System

COMMERCIALIZATION

- Integrates with SIEM and SOAR platforms, targeting the \$25B+ Enterprise SOC and Threat Detection market
- The global AI in cybersecurity market is projected to reach \$100+ billion by 2030
- Offered as a modular SaaS cybersecurity solution

Target customers :

- Finance Sector
- Healthcare Organizations
- Technology Companies
- Government Institutions
- Designed for Medium to Large Enterprises requiring scalable threat detection

THANK YOU!
